AAR77033

Mast cell function-associated antigen, MAFA, soluble, ligand, identification; screening; inflammation; inflammatory; allergy; allergic; prevention. Novel DNA encoding a mast cell function-associated antigen (MAFA) - useful for screening for ligands of MAFA which are useful for prevention of inflammatory and allergic reactions. A soluble form of mast cell function-associated antigen (MAFA) can be produced by recombinant techniques for use in the ligand- screening assay. The ligands that are identified may be used alone or in combination with the MAFA to prevent inflammatory and allergic reactions Length 188; Mammalian mast cell function-associated antigen (MAFA). Query Match 100.0%; Score 1036; DB 2; Best Local Similarity 100.0%; Pred. No. 1.8e-96; Matches 188; Conservative 0; Mismatches 0; Claim 12; Page 37; 54pp; English. The invention relates to cloning of the human MAPA molecule (see AAW88265) and to the discovery of splice variants (see AAW88266-67) of human MAPA that are not found in rat. Polypeptides and synthetic peptides (see AAW88256-64) based on human MAPA and human truncated MAPA, and polynucleotides encoding them, can be used in methods for the treatment of inflammatory and allergic diseases (e.g. rheumatoid

arthritis and asthma), and tumour growth

Sequence 188 AA;

```
The present invention relates to a pharmaceutical composition comprising an agent which specifically binds to a mast cell function associated antigen (MARA) ligand on a target cell, and prevents or inhibits natural killer (NK) - or T-cell-expressed cell surface MARA from binding to MARA tigand and a pharmaceutically acceptable excipient. The invention is useful for inhibiting an NK- or T-cell-expressed cell surface MARA binding to a ligand on a target cell, by contacting the pharmaceutical composition in vitro, ex vivo or in vivo by administering the composition and amount sufficient to inhibit cell surface MARA binding to the ligand on the target cell. The agent or the composition is useful for treating a newour by stimulating the cyctoxic activity of an NK cell or a cytotoxic T-cell (CTL), where the tumour comprises an NK cell- or TL-susceptible tumour cell. The invention is also useful for inhibiting an activity of NK cell or a T-cell. The present sequence is rat MARA protein

to the subject, to NK or T-cell or the target cell e.g. tumour cell, in an amount sufficient to inhibit cell surface MAFA binding to the ligand on the target cell. The agent or the composition is useful for treating a tumour by stimulating the cytotoxic activity of an NK cell or a cytotoxic T-cell (CTL), where the tumour comprises an NK cell- or CTL-susceptible tumour cell. The invention is also useful for inhibiting an activity of NK cell or a T-cell. The present sequence is mouse MAFA protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a pharmaceutical composition comprising an agent which specifically binds to a mast cell function associated antigen (MAFA) ligand on a target cell, and prevents or inhibits natural killer (NK) - or T-cell-expressed cell surface MAFA from binding to MAFA ligand and a pharmaceutically acceptable excipient. The invention is useful for inhibiting an NK- or a T-cell-expressed cell surface MAFA binding to a ligand on a target cell, by contacting the pharmaceutical composition in vitro, ex vivo or in vivo by administering the composition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of human mast cell function- associated antigen (MAFA) splice variant huMAFA(E3/4-), which lacks the C-lectin-like domain of human MAFA (see AAMW8826) but retains the intracellular and transmembrane domains as well as the extracellular C-terminal tail. Truncated MAFA polypeptides including huMAFA(E3/4-), and polynucleotides encoding them, as well as synthetic peptides (see AAW88258-64, AAW88268-72), can be used be used in compositions for the treatment of inflammatory and allergic diseases (e.g. rheumatoid arthritis and asthma), or tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

The sequence represents human INTERCEPT 289 form 2a polypeptide. This protein and similar others exhibit the ability to affect growth, proliferation, survival, differentiation, activity, morphology, or movement/migration of, e.g. T cells and cells of the heart, liver, pancreas, placenta, brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marrow or thymus tissue. They can be used as modulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, prevent, diagnose, or treat disorders associated with physiological processes. These disorders include abnormal blood coagulation, asthma, anaphylaxis, hepatitis, multiple sclerosis, cancer, coronary artery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid molecule for diagnosis, prevention, and therapy of human and other animal disorder, or as modulating agent for regulating

The invention relates to secreted polypeptide-related proteins and nucleic acids (TANGO and INTERCEPT proteins and nucleic acids). The nucleic acids, proteins and antibodies specific to the proteins are nucleic acids, proteins and antibodies specific to the proteins are useful in screening assays, predictive medicine (e.g. diagnostic assays, prophostic assays, monitoring clinical trials and pharmacogenetics) and prophylactic and therapeutic methods. The sequences are used in diagnosing, preventing or treating proliferative disorders (e.g. annutiple sclerosis or lugus), neurological disorders (e.g. multiple sclerosis or lugus), neurological disorders (e.g. Alzheimer's disease or Parkinson's disease), cardiovascular clisorders (e.g. thromboytopenia or ansemia) and disorders involving blood vessels (e.g. thromboytopenia or ansemia) and disorders acids may also be used in chromosome mapping, tissue typing and forensic clology, and as surrogate markers. This sequence represents a secreted polypeptide-related protein of the invention. Note: The sequence data for this patent was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        92 EKRDWNSSLKFCADKGSHLLTFPDNQGVNLFQEYVGEDFYWIGL---RDIDGWRWEDGPA 148

                                                                                                                                                                             The invention relates to isolated nucleic acid molecules encoding novel human secreted extracellular matrix proteins (SPS). The polynucleotides and proteins are used to prevent, treat a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. For example, disorders associated with decreased expression of SPs. The SP polynucleotide or a vector expressing them may be administered to treat diseases by gene therapy. Antisense molecules may be administered to down regulate expression of SPs by binding with the cells own genes and preventing their expression. The polynucleotides may also be used as DNA probes in diagnostic assays. The SPs may also be used as DNA probes in diagnostic assays. The SPs may also be used as DNA
                                                                                                                                                                                                                                                                                                                                    produce antibodies and to identify modulators (agonists and antegonists) of the SPs. The anti-(SP) antibodies and antagonists may also be used to demonstrate the SPs. The anti-(SP) antibodies and antagonists may also be used to deven regulate expression and activity of SP and as diagnostic agents for example: immune/autoimmune diseases (E.g. HIV (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (E.g. melanomas, neoplasms of the breast or liver, Sezary syndrome and Gaucher's disease), neurological diseases (E.g. Alzheimer's disease, Parkinson's disease), neurological /cerebrovascular disorders (E.g. cardiac arrest, tachycardia and angina), infections caused by bacteria, viruses and fungi and ocular disorders (E.g. corneal infections). Other uses include wound healing, maintenance of organs before transplantation, support of cell culture of primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CGSKGFMCSQCSRCPNLWMRNGSHCYYFSMEKRDWNSSLKFCADKGSHLLTFPDNQGVNL 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-SEP-2
        medical conditions e.g. by protein or gene therapy. The genes are solated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and oversam cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or unogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune heamolytic can anemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial isobaemias; (d) wound healing (e) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

```

```
The invention relates to an isolated nucleic acid molecule (cDNA) encoding a human extracellular matrix protein, representing one of 161 novel genes. Also include are recombinant vectors, host cells (expressing the protein), the extracellular matrix proteins (including
New isolated nucleic acids and polypeptides, useful for diagnosing, treating, and/or preventing disorders, such as cancer, infections, cardiovascular and inflammatory diseases.
```

```
their fragments, epitopes and homologues), an isolated antibody that binds specifically to the protein, diagnosing a pathological condition or susceptibility to a pathological condition (comprising determining the presence or absence of a mutation in the mucleic acid and diagnosing a condition based on the presence or absence of the mutation), diagnosing a pathological condition or susceptibility to a pathological condition or condition or susceptibility to a pathological condition or protein in a biological sample and diagnosing a condition based on the protein in a biological sample and diagnosing a condition based on the protein in a mammalian subject, identifying a binding partner to the protein to a mammalian subject, identifying a binding partner to the protein, the gene corresponding to the cDNA sequence, and identifying an ectivity in a biological sassy (comprising expressing the nucleic acid in a cill, isolating the supernatant, detecting an activity in a biological cassy and identifying the protein in the supernatant having the activity. The nucleic acids and proteins display the following activity. The nucleic acids and proteins display the following activities Cytostatic, antibacterial, viruciach, Neuroprotective, Gymaecological, Gastointestinal-den, Cardiant, Cardiovascular-Gen, Nephrotropic, Antiinflammatory, Muscular-Gen, Respiratory-Gen,

                                                                                                                                                                                        production of other cytokines in other cell populations. The populations of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581) 2111

(AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                  The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        wound; ulcer; thrombocytopaenia; osteoporosis; osteoarthritis; inflammation; Alzheimer's disease; Parkinson's disease; stroke; Huntington's disease; amyotrophic lateral sclerosis; HUV; immune deficiency; human immunodeficiency virus infection; severe combined immunodeficiency; infection; autoimmune disorder; rheumatoid arthritis; Guillain-Barre syndrome; graft-versus-host disease; cancer; thyroid cancer; lung cancer; syndrome; graft-versus-host disease; Kaposi's sarcoma; brain tumour; prostate cancer; ovarian cancer; chu, disorder; inflammatory bowel disease; chu, disorder; inflammatory bowel disease;

The invention relates to an isolated polynucleotide encoding a cytokine or cell proliferation/differentiation-related protein (or the mature protein or active domain), sequences greater than 90% identical to it or sequences complementary to it. Also included are the encoded proteins, expression vectors, transformed host cells, antibodies, and identifying a compound that binds to the polypeptide. The polynucleotide, polypeptides compound that binds to the polypeptides are useful in therapeutic, diagnostic or research methods. They are particularly useful crampedicial treating or preventing e.g. anaemias, wounds, ulcers, thrombocytopeania, osteoporosis, osteoarthritis, inflammations, continued or preventing e.g. anaemias, wounds, ulcers, thrombocytopeania, osteoporosis, osteoarthritis, inflammations, amyotrophic lateral sclerosis, stroke, immune deficiencies (e.g. human immunodeficiency virus (HIV), severe combined immunodeficiency or infections), autoimmune disorders (e.g. rheumatoid arthritis, Guillain-cancer, lung cancers, small cell carcinoma, Kaposi's sarcoma, brain cuncers, prostate cancer, ovarian cancer or leukaemias), or inflammatory disorders (e.g. inflammatory bowel disease or Crohn's disease). The polymucleotides and proteins are useful for screening peptides or small cell cancell inhibitors or agonists that are useful for treating these diseases. The polypeptide is also useful as molecular markers, or as a food supplement. The present sequence is a cytokine or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ŋ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     98 SSLKFCADKGSHLLTFPDNQGVNLFQEYVGEDFYWIGL-RDIDGWRWEDGPALSLSIL-- 154

```
New isolated nucleic acid molecule for diagnosis, prevention, and therapy of human and other animal disorder, or as modulating agent for regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents human INTERCEPT 289 form 2a polypeptide. This protein and similar others exhibit the ability to affect growth, proliferation, survival, differentiation, activity, morphology, or movement/migration of e.g. Teells and cells of the heart, liver, pancreas, placenta, brain, lung, skeletal muscle, kidney, spleen, lymph node, peripheral blood leukocyte, bone marrow or thymus tissue. They can be used as modulating agents for regulating cellular processes, thus, the proteins and their associated nucleic acids can be used to prognosticate, prevent, diagnose, or treat disorders associated with physiological processes. These disorders include abnormal blood coagulation, asthma, anaphylaxis, hepatitis, multiple sclerosis, cancer, coronary artery disease, malaria, atopic dermatitis, amyotrophic lateral sclerosis, meningitis, attention deficit disorder, Crohn's disease, gastroenteritis,
                                                                                                                                                                                                                                                                                                                              Human; INTERCEPT 289; T cell; heart; liver; pancreas; placenta; brain; skeletal muscle; kidney; spleen; lymph node; peripheral blood leukocyte; bone marrow; thymus tissue; abnormal blood coagulation; asthma; cancer; anaphylaxis; hepatitis; multiple sclerosis; coronary artery disease; malaria; atopic dermatitis; multiple sclerosis; coronary artery disease; mattention deficit disorder; Crohn; disease; gastroenteritis; goltre; hypoglycaemia; diabetes mellitus; endometriosis; pulmonary embolism; muscular dystrophy; immuno-competence; vertebrate; blood; serum; lung.
